## Overriding the *equals* Method

File *Player.java* contains a class that holds information about an athlete: name, team, and uniform number. File *ComparePlayers.java* contains a skeletal program that uses the *Player* class to read in information about two baseball players and determine whether or not they are the same player.

1. Fill in the missing code in *ComparePlayers* so that it reads in two players and prints "Same player" if they are the same, "Different players" if they are different. Use the *equals* method, which *Player* inherits from the *Object* class, to determine whether two players are the same. Are the results what you expect?
2. The problem above is that as defined in the *Object* class, *equals* does an address comparison. It says that two objects are the same if they live at the same memory location, that is, if the variables that hold references to them are aliases. The two *Player* objects in this program are not aliases, so even if they contain exactly the same information they will be "not equal." To make *equals* compare the actual information in the object, you can override it with a definition specific to the class. It might make sense to say that two players are "equal" (the same player) if they are on the same team and have the same uniform number.
  - ☐ Use this strategy to define an *equals* method for the *Player* class. Your method should take a *Player* object and return true if it is equal to the current object, false otherwise.
  - ☐ Test your *ComparePlayers* program using your modified *Player* class. It should give the results you would expect.

```
// *****
// Player.java
//
// Defines a Player class that holds information about an athlete.
// *****

import java.util.Scanner;

public class Player
{
    private String name;
    private String team;
    private int jerseyNumber;

    //-----
    // Prompts for and reads in the player's name, team, and
    // jersey number.
    //-----

    public void readPlayer()
    {
        Scanner scan = new Scanner(System.in);
        System.out.print("Name: ");
        name = scan.nextLine();
        System.out.print("Team: ");
        team = scan.nextLine();
        System.out.print("Jersey number: ");
```

```

        jerseyNumber = Scan.nextInt();
    }

}

// *****
// ComparePlayers
//
// Reads in two Player objects and tells whether they represent
// the same player.
// *****
import java.util.Scanner;
public class ComparePlayers
{
    public static void main(String[] args)
    {
        Player player1 = new Player();
        Player player2 = new Player();

        Scanner scan = new Scanner();

        //Prompt for and read in information for player 1

        //Prompt for and read in information for player 2

        //Compare player1 to player 2 and print a message saying
        //whether they are equal

    }
}

```
